ACKNOWLEDGEMENTS

The completion of this report was assisted by the generous contribution of many people. First, there are the fishermen who consented to a personal interview and submitted to the completion of a lengthy questionnaire. Second, there are the staff of the Fishing Industry Advisory Board, with whom this year's survey was a joint undertaking. The staff of the FIAB were involved in the sampling, interviewing and editing aspects of the survey. Third, there are the field staff of the Fisheries Operations Branch who conducted the interviews and the field staff from the Statistics and Systems Branch who coordinated the surveys. Fourth, organizations such as the Fisheries Loan Board, the Canadian Saltfish Corporation, financial institutions and processing companies provided valuable assistance in supplying and verifying some of the data presented herein. Finally, we are particularly indebted to Sandra Savory of the Statistics and Systems Branch who supplied vital computer support services.

The contribution of the people and organizations noted above is reflected by the depth of detail and precision embodied in this report. To these and others we may have inadvertently omitted, we tender our sincere gratitude. As always, any errors or omissions remain the responsibility of the Economics Branch, Newfoundland Region.

SECTION I: INTRODUCTION

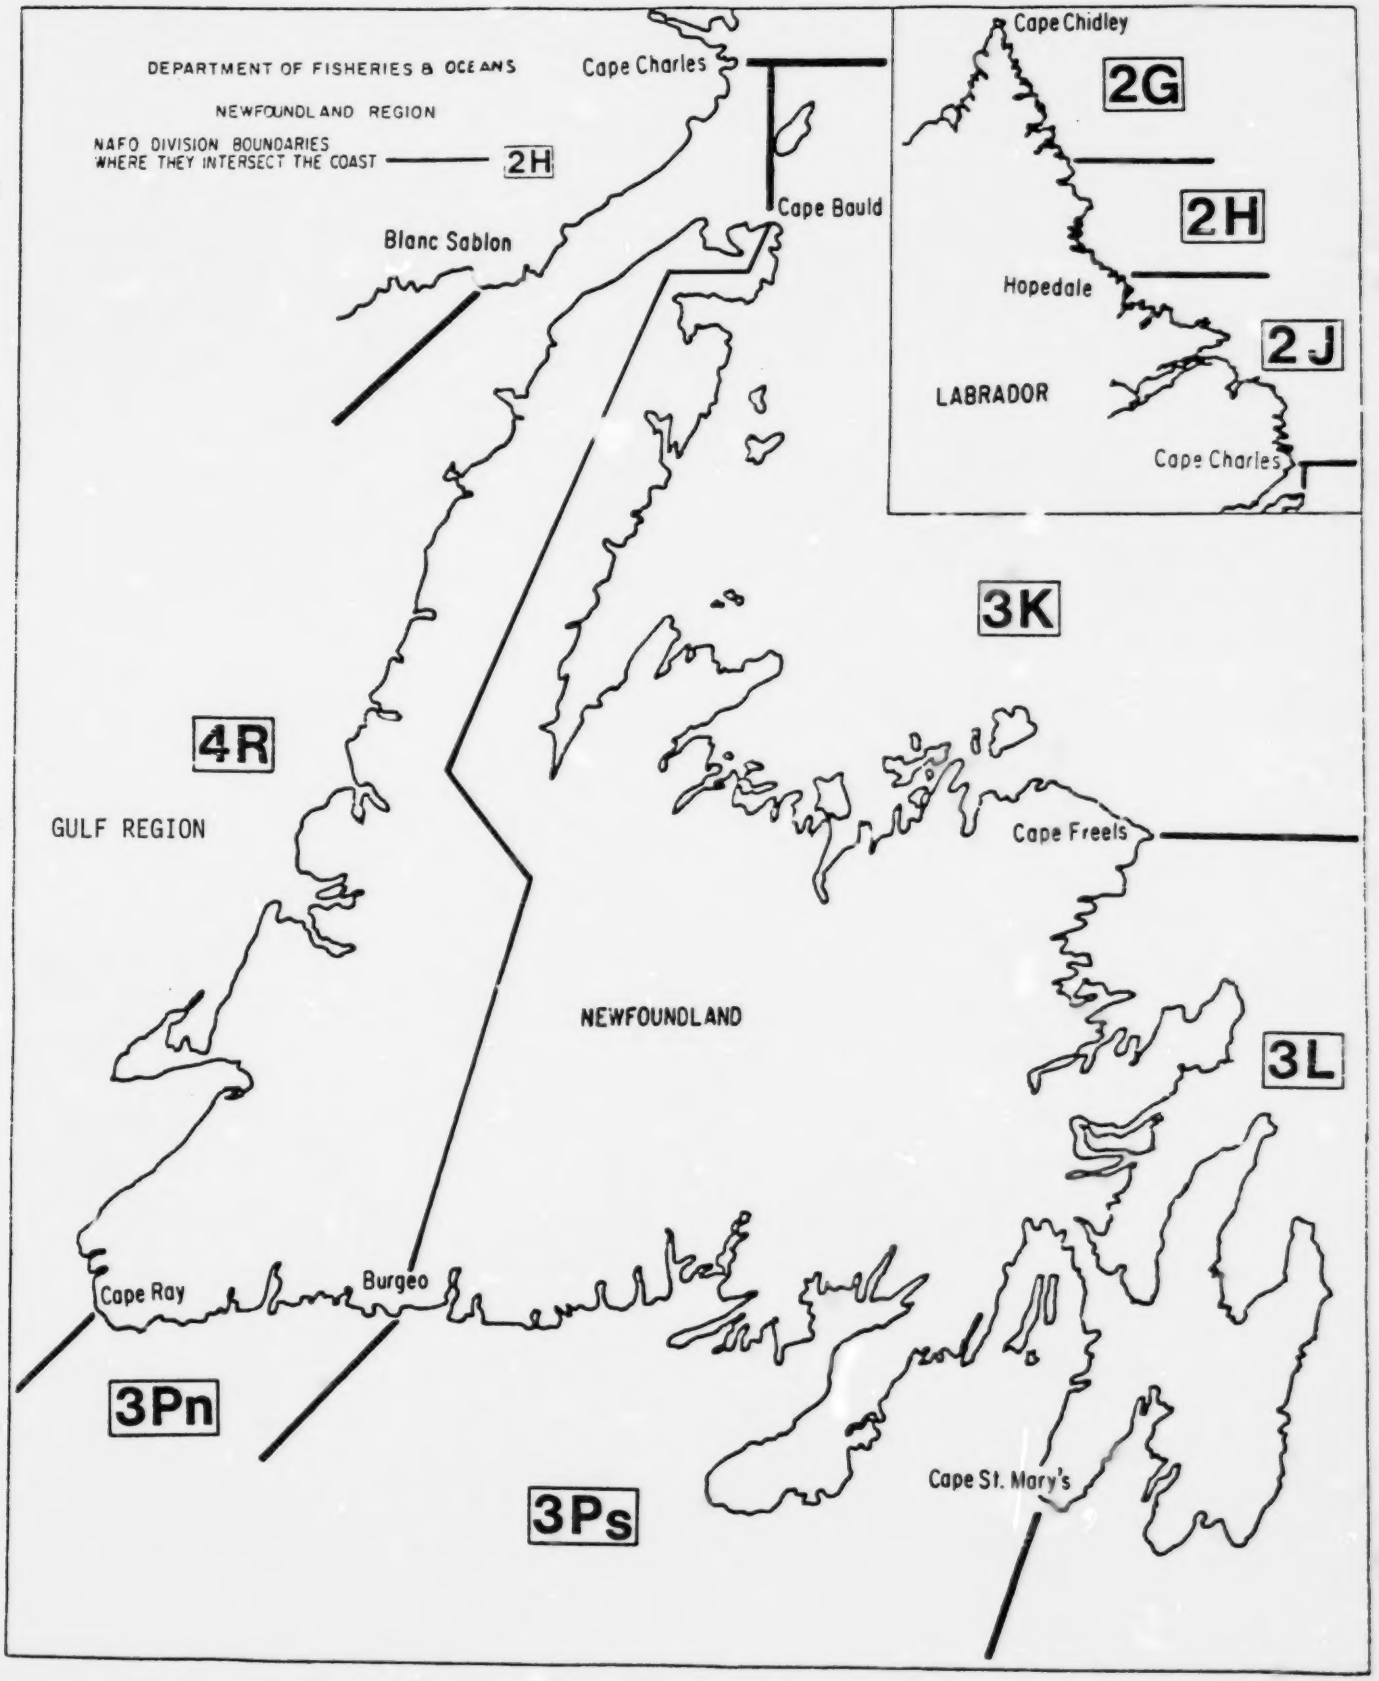
This report contains costs and earnings data on a sample of full-time inshore (vessels less than 35 feet length overall (LOA)) and nearshore (vessels 35-64 feet LOA) fishing enterprises that were active during the 1985 fishing season in NAFO Divisions 3K, 3L and 3Ps of the Newfoundland Region[1] (Figure 1). For the purpose of this report, a fishing enterprise refers to all vessels, gear, facilities and equipment owned and used by an individual, partnership or privately incorporated company and any vessels, gear, facilities and equipment owned by a crewmember and used by an enterprise in the fishery. Enterprises are categorized based on the length overall of the primary (most important) fishing vessel as designated by the skipper.

The data for both the inshore and nearshore sectors have been presented at several levels of aggregation. At the highest level, data are presented for the Newfoundland Region (island portion only) as a whole. These data are then disaggregated on the basis of the three NAFO Divisions (3K, 3L and 3Ps) to enable intra-regional comparisons. Finally, the data for each NAFO Division are disaggregated by type of enterprise to allow contrast between these groupings. For the inshore sector, these enterprise categories are based on the length of the primary vessel and

---

[1]Manpower constraints prevented surveys from being carried out in coastal Labrador and therefore the sample was limited to the insular portion of the Newfoundland Region.

FIGURE 1: NORTH ATLANTIC FISHERIES ORGANIZATION
DIVISION BOUNDARIES, NEWFOUNDLAND AND LABRADOR



include enterprises with primary vessels less than 25 feet and enterprises with primary vessels 25-34 feet. For nearshore enterprises, categories were based on length overall of the primary vessel and/or the major type of fishery pursued. In NAFO Divisions 3K and 3L this enabled four classifications to be identified - crab enterprises, purse seine enterprises, groundfish enterprises with primary vessels 35-44 feet and groundfish enterprises with primary vessels 45-64 feet. In NAFO Division 3Ps groundfish enterprises with primary vessels 35-44 feet and 45-64 feet were identified.

The magnitude of the inshore and nearshore samples was determined using two different techniques.[1] The number of nearshore vessels to be interviewed was selected after a statistical analysis was undertaken of the nearshore vessel landings data for nearshore enterprises landing in excess of $3,000. The analysis identified the number of vessels that would have to be sampled in each fleet sector for the sample results to be accurate within plus or minus 20%, 9 times out of 10. The desired nearshore sample was 217, of which the initial 121 to be interviewed were chosen from respondents to the 1984 survey. The remaining 96 were selected from a random sample of nearshore

---

1 "Sampling Methodology for the Newfoundland Region Costs and Earnings Survey", Economics Branch, Department of Fisheries and Oceans, Newfoundland Region, October, 1985.

vessel owners. Of the desired sample of 217 vessel owners, only 209 usable surveys were obtained after allowance for logistical difficulties and incomplete questionnaires.

In view of the lack of inshore vessel landings data, it was impossible to calculate the sample size required to obtain survey information on the inshore fishery, of a certain pre-determined statistical accuracy. The inshore sample was selected from a list of inshore vessel owners stratified by NAFO Division and the length of their primary (largest) vessel. A telephone contact was used to both identify the actual inshore vessel owners who would be surveyed and to estimate the number of inshore enterprises with in excess of $1000 in landings in 1985. Of the estimated 4,129 active inshore enterprises, the actual final inshore sample was comprised of 286 enterprises, an overall sampling ratio of 6.9 percent. Of the inshore vessels surveyed, 125 had been sampled in 1984. The sampling weights in Appendix I (p. 77) are used to convert sample results by fleet sector into results that are representative for NAFO Divisions 3K, 3L and 3Ps, as well as, the island portion of the Newfoundland Region in its entirety.

The data from each enterprise was obtained by a detailed questionnaire and personal interview with the skipper and/or the individual responsible for maintaining the records. Wherever possible all information was verified by receipts kept by the enterprise, but when this was not possible, the skipper provided

his best estimate. Relevant information for each enterprise was also collected from the Fisheries Loan Board, the Canadian Saltfish Corporation, chartered banks, and accounting firms. In addition, landings and landed value data for the nearshore sample were checked against the records of the Statistics and Systems Branch of the Department of Fisheries and Oceans.[1] All data were processed by computer using the Fishing Enterprise Survey System (FESS) which is based on the Scientific Information Retrieval (SIR) database system.

It was not possible to interview all of the individuals selected for the sample which thus reduced the actual sample size. In other instances, interviews were carried out but the questionnaires were unusable because of major discrepancies or omissions in the data. Consequently, a total of only 495 usable questionnaires were obtained from the original sample, comprised of 286 and 209 enterprises in the inshore and nearshore sectors, respectively.

This report is based upon the methodology and definitions developed by the Economics Branch and presented in previous studies.[2] Since these studies have received wide circulation, elaboration is not provided here. The remaining sections provide

---

[1]The Statistics and Systems Branch does not record these data for individual inshore enterprises.

Fisher, C.F. et al., The Economic Performance of Fleets Engaged in the Gulf of St. Lawrence Shrimp Fisheries - 1979. Task Force Report of the Gulf Shrimp Advisory Committee, Department of Fisheries and Oceans, October, 1981.

information respecting structural characteristics, investment in vessels, facilities and equipment, operational characteristics and the financial performance of inshore and nearshore enterprises at the levels of disaggregation outlined earlier.

SECTION II: STRUCTURAL CHARACTERISTICS

This section provides information on the structural characteristics of the sampled inshore and nearshore enterprises. Included is information respecting the type of ownership, the number and type of vessels owned, vessel length, age, brake horsepower and gross registered tonnage, crew size and number of days and weeks fished per enterprise. It should be noted that gross registered tonnage is not recorded for inshore enterprises. In addition, days (weeks) fished means any day (week) in which landings of fish were recorded. If, for instance, a fishing enterprise recorded fish landings for only one day in a given week while another enterprise recorded landings for five days, each enterprise would be assessed with one week of fishing activity but the former would have only one day of fishing activity compared to five for the latter.

Table 1(A) outlines these characteristics for all inshore and nearshore enterprises in each of the three NAFO Divisions and for the Newfoundland Region in total. It also illustrates the distribution of the sampled inshore and nearshore enterprises. Of the 286 inshore enterprises, 106 are found in Division 3K, 110 in Division 3L and 70 in Division 3Ps. The 209 nearshore enterprises are distributed with 79 from Division 3K, 88 from Division 3L and 42 from Division 3Ps. Table 1(B) disaggregates the data

presented in Table 1(A) for the inshore enterprises by NAFO Division and by type of enterprise and illustrates the distribution of enterprises within each category. Table 1(C) provides similar information respecting the nearshore enterprises.

TABLE 1(A)

[2]Primary Vessel.

[3]Days Fished means any day in which landings of fish were recorded.

[4]Weeks Fished means any week in which landings of fish were recorded.

SECTION III: INVESTMENT IN VESSELS, FACILITIES AND EQUIPMENT

This section profiles the investment characteristics of the sampled inshore and nearshore enterprises. Data are presented to illustrate sources of vessel financing (Tables 2(A)-(C)), average investment in vessels (Tables 3(A)-(C)), investment in vessels by cost component (Tables 4(A)-(C)), total and net investment in vessels, facilities and equipment (Tables 5(A)-(C)) and debt (Tables 6(A)-(C)). In all instances, the first of each series of tables provides data for the inshore and nearshore enterprises in each NAFO Division as well as for the Newfoundland Region as a total. The second and third tables disaggregate the data for inshore and nearshore enterprises, respectively, by NAFO Division and by type of enterprise.

To arrive at net investment in vessels, facilities and equipment, the vessel subsidies received by each enterprise category were subtracted from the total investment by that category. Subsidy data are included only in respect of those vessels retained by their original owners. With respect to the debt profiles, it should be noted that for many enterprise categories, some individuals repaid the interest due plus principal while others were incapable of meeting interest payments. This explains why for these categories the 'average' enterprise

experienced both an increase in debt due to non-payment of interest and a decrease in debt due to repayment of principal. The normal banking procedure is that principal cannot be reduced if interest charges are outstanding.

TABLE 2(A)

DISTRIBUTION OF INSHORE AND NEARSHORE ENTERPRISES BY SOURCE OF VESSEL FINANCING USED BY NAFO DIVISION[1]

	INSHORE ENTERPRISES BY DIVISION				NEARSHORE ENTERPRISES BY DIVISION			
	3K	3L	3Ps	TOTAL	3K	3L	3Ps	TOTAL

FLB = Fisheries Loan Board

SECTION IV: OPERATIONAL CHARACTERISTICS

The data in this section have been compiled to provide an overview of the operational characteristics of the surveyed enterprises. The first set of Tables 7(A)-(C) show the average value of fishing gear. The remaining twelve sets of tables present fishing effort, fish landings and landed values. As before, information for the average inshore and nearshore enterprise in each NAFO Division and for the Newfoundland Region as a whole is presented first. In subsequent tables, information is provided by type of inshore and nearshore enterprise in each NAFO Division.

Data describing fishing effort include the distribution of enterprises by type of gear owned (Tables 8(A)-(C)), the distribution of enterprises by type of gear fished (Tables 9(A)-(C)), the distribution of enterprises by number of days at sea and number of days fished (Tables 10(A)-(C)) and average number of days fished by gear type (Tables 11(A)-(C)). As a point of clarification, it should be kept in mind that number of days at sea refers to any day in which a trip was made outside port for the purpose of setting and/or retrieving gear and/or fishing, whereas, number of days fished refers only to any day in which fish landings were recorded. Also, the average number of days fished by gear type refers not to the average number of days on which a particular gear type was fished but represents the average number of equivalent full days spent fishing that gear. To illustrate, consider an enterprise which fished longlines,

lobster pots and gillnets for an equal amount of time for three full days. In this instance, three days fishing would have been recorded with one day allocated to each gear type.

Tables 12(A)-(C) describe the average landings of the surveyed enterprises by type of gear fished while Tables 13(A)-(C) illustrate the average landed values derived from using these gears. The average price received by each gear type/enterprise combination per landed kilogram is also provided (Tables 14(A)-(C)) and is derived by dividing the relevant average landed value by the relevant average landings. Data are also provided with respect to average landings by species (Tables 15(A)-(C)), average landed value by species (Tables 16(A)-(C)) and average price received per landed kilogram of each species (Tables 17(A)-(C)). The three sets of tables respecting type of gear fished provide information which sometimes may appear inconsistent with information provided in the tables respecting species. Such incongruities are attributable to the fact that some species are taken as by-catch in gear types directed at another species, e.g. salmon landings from cod traps, and affect the figures accordingly. Also, it is difficult in some instances to distinguish what groundfish species were caught in the various groundfish gears.

Two final sets of tables are presented in this section. Tables 18(A)-(C) describe the distribution of the inshore and nearshore enterprises by range of landings. The distribution of the enterprises by range of landed value is provided in Tables 19(A)-(C).

SECTION V: FINANCIAL PERFORMANCE

This section profiles the financial performance of the surveyed inshore and nearshore enterprises. Tables 20(A)-(C) present data respecting the average revenues and expenses by type of enterprise and NAFO Division for each fleet sector. Revenues consist of fish sales, rebates/subsidies and other income generated through use of fishing equipment and/or vessels. Costs are comprised of operating, repair and maintenance, net gear purchases and fixed costs as presented in the tables. The difference between revenues and costs represent the amount available to cover crew costs and depreciation on vessels and facilities and equipment.

Crew costs are, for most enterprises, based upon 'sharing' arrangements which provide for shares to be allocated to both crew and vessel. The vessel share is allocated to cover operating, repair and maintenance and fixed costs. In certain enterprises, however, these costs are divided evenly among the crew and paid from the share received by the skipper and the deckhands. No share is explicitly allocated to the vessel. For these enterprises the vessel was treated as an additional crewmember and an equal share allocated. Thus an enterprise with a three-man crew which shared revenues in three equal amounts was assumed to have four equal shares with each crewmember (including the skipper) receiving 25% and the vessel 25%.

Table 21 provides information on the average number of crewmembers on inshore and nearshore enterprises and Table 22 illustrates the average incomes of each.
